Proactive Cyber Threat Intelligence

Problems we are solving

Hidden Breaches

Stolen credentials and sensitive data are traded in underground forums before organizations even notice a breach. Most companies lack visibility into these hidden channels, leaving them blind to early warning signs.

Delayed Response

Traditional cybersecurity tools detect threats only after systems are compromised. This delay allows attackers time to exploit stolen data, causing reputational and financial damage.

Alert Overload

Security teams face information overload and miss critical alerts. Without automated, AI-driven intelligence, analysts struggle to prioritize real threats from noise.

Solution

Dark Web Monitoring

Continuous scanning of underground forums and marketplaces to detect leaked data before it spreads.

Real-Time Alerts

Instant notifications when compromised data tied to your organization is found, enabling faster action.

AI-Powered Detection

Machine learning models classify and prioritize threats, cutting through noise and highlighting real risks.

Seamless Integration

Works with existing SOC and MSSP workflows, reducing manual effort and strengthening overall defense.

Why Now_

Dark Web Expansion

Criminal marketplaces and leak sites are growing fast, creating new blind spots for organizations.

AI Maturity

Recent breakthroughs in LLMs and automation now make large-scale dark web analysis possible in real time.

Market Gap

Few competitors offer end-to-end AI threat intelligence — the space is wide open for disruption.

Market Opportunity

the full revenue opportunity from all mid-sized companies and SMEs in Healthcare, Fintech, Telecom, Insurance, and LogTech across MENA at \$400 per month

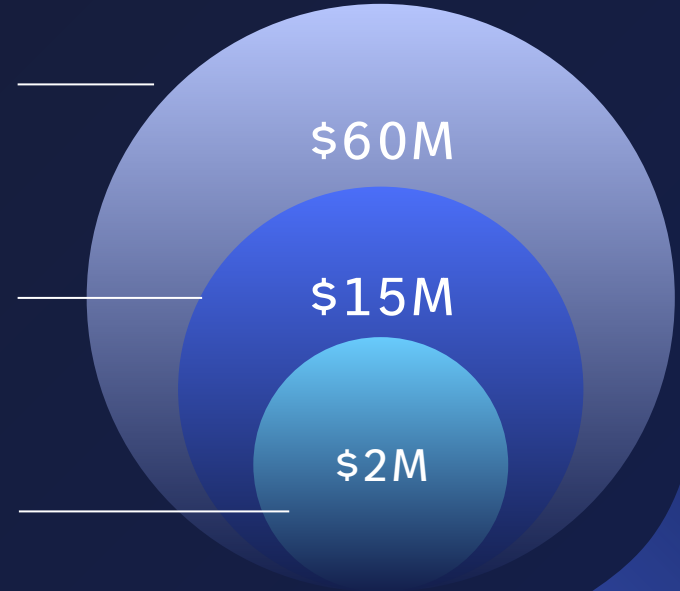

the portion of TAM we can realistically reach initially focusing on the most digitally mature companies in these sectors

the revenue we can capture in the first few years with our initial go-to-market efforts
